

Day 15 – python training

we started working on another mini project – an **Instagram Bot** using Python. This project was both exciting and challenging, as it involved automation and working with an actual social media platform.

We began by setting up the basic structure of the bot. We installed necessary libraries, explored how to log in to an Instagram account using code, and tested some basic functions like viewing a profile and reading post information.

We discussed how automation can help in saving time and performing repetitive tasks like liking, commenting, or messaging. It was a fun session that combined Python knowledge with real-world automation tools.
