

Day 16 – Python training

Today, we continued developing the Instagram Bot and added more features to improve its functionality.

We implemented login authentication, message sending, and fetching followers or post details. The session helped us understand how to handle real-time data, work with APIs, and manage exceptions and errors during execution.

We also worked on improving the GUI using tkinter to make it user-friendly. The project is progressing well, and I'm learning how to apply Python in real-world automation scenarios.
